

**METHOD AND DEVICE FOR ACCESSING A MOBILE SERVER
TERMINAL OF A FIRST COMMUNICATION NETWORK BY MEANS
OF A CLIENT TERMINAL OF ANOTHER COMMUNICATION
NETWORK**

ABSTRACT OF THE DISCLOSURE

A method and apparatus are provided for enabling at least one client terminal, which is connected to a first communication network, to access the data and/or services of a mobile server terminal, which is connected to a second communication network. The first and second networks can coexist on or form a single network. One such method includes at least the following steps: a communication session is initialized by the client terminal with the mobile server terminal; and the communication session is established by opening a direct communication tunnel between the client terminal and the server terminal. In this way, the client terminal can consult the information made available by the server terminal and/or the client terminal can use and/or interact with all or part of the services of the server terminal.
